

DEBRIDEMENT GUIDANCE STATEMENT

AUTHORSHIP AND EDITING

PRIMARY AUTHOR: BRAD BICHEY MD MPH

EDITED BY: JIM ATKINS MD

STATES COVERED BY CASE SUBMISSIONS BY DATE

JUNE 16, 2020: CALIFORNIA, CONNECTICUT, FLORIDA, INDIANA, TEXAS

JULY 13, 2020: CALIFORNIA, CONNECTICUT, FLORIDA, GEORGIA, MICHIGAN, NEW JERSEY, NEW YORK, INDIANA, TEXAS

CASE DATA REVIEWED BY DATE

JUNE 16, 2020: Total Cases Submitted 221, Total Procedures 467

110 DEBRIDEMENT CASES REVIEWED (DATABASE USED: SINUS SURGERY RESPONSES LOCKED 6-16-20-12-45)

JULY 13, 2020: Total Cases Submitted 2458, Total Procedures 2919

244 DEBRIDEMENT CASES REVIEWED (DATABASE USED: SINUS SURGERY RESPONSES LOCKED 07-13-20-12-38)

PRIMARY CONSIDERATIONS

- Individual procedures on sinusoutcomes.org are considered for review after approximately 100 cases of the particular procedure have been submitted. Previously reviewed procedures are considered for additional review after every 100 subsequent procedures have been submitted. Each review attempts to determine safety considerations based on data related to the primary outcomes reported.
- Since the onset of the pandemic, the United States has seen different disease characteristics for the virus, state by state, based on multiple factors. Each review of the data will show the size of the data set and the states included in the data set. Results from one set of state specific data or report cannot necessarily be extrapolated to states that have not yet reported data.
- The primary outcomes reported are:
 - Was there any COVID-19 infections reported in the dataset
 - Was there any presumed transmission of COVID-19 to patients
 - Was there any presumed transmission of COVID-19 to surgeons
 - Was there any presumed transmission of COVID-19 to staff

PRIMARY FINDINGS

Data submitted up to June 16, 2020 Primary Outcomes:

- Number of Debridement Cases Reviewed: 244 cases
- COVID-19 infections reported in the dataset: none reported
- Presumed transmission of COVID-19 to patients: none reported
- Presumed transmission of COVID-19 to surgeons: none reported
- Presumed transmission of COVID-19 to staff: none reported

GUIDANCE ON THE SAFETY OF OFFICE DEBRIDEMENTS

Data Submitted up to July 13, 2020 General Case Data on Anesthesia Used

Discussion: The data set reviewed showed that the majority of cases were performed in the office setting using primarily Topical anesthesia or no anesthesia. No particular type of anesthesia showed any increased risk profile for the covered period.

Data submitted up to July 13, 2020 PPE used during the procedure by the Doctor

Data submitted up to July 13, 2020 PPE used during the procedure by the Staff

Data submitted up to July 13, 2020 PPE used during the procedure by the Patient

Data submitted up to July 13, 2020 PPE Additional Safety Measures Used

Discussion: The majority of cases performed in this data set showed use of N95 surgical masks, gloves, and eye protection by both the surgeon and staff. Physicians also reported using a full face shield in about 50% of procedures, however this did not correlate with a change in risk profile for case transmission of COVID-19 in the office setting.

In 90% of cases patients were not required to use additional PPE during the procedure. This had no effect on Covid-19 infections. Also, about 35% of respondents did not use any additional safety measures for the case. HEPA filtration and Iodine wash ranked first and second in this data set when additional safety measures were studied. Both of these measures were used over 60% of the time with patients. In this data set, requiring the patient to use PPE during the procedure or using additional safety measures during the procedure does not appear to improve the safety or risk profile of post-operative debridement in the office setting.

Safety Opinion: As of July 13, 2020 Office Debridements are safe to perform using reasonable precautions in the office setting in the states of California, Connecticut, Florida, Georgia, Michigan, New Jersey, New York, Indiana, Texas.
